

# Reversing with Radare2

## Starting Radare

The basic usage is **radare2** *exe* (on some systems you can use simply **r2** instead of **radare2**). If there exists a script named *exe.r2*, then it gets executed after the others rc-files. If you want to run radare2 without opening any file, you can use **--** instead of an executable name.

Some command-line options are:

```
-d file      debug executable file
-d pid      debug process pid
-A          analyze all referenced code (aaa command)
-r profile.rr2 specifies rarusn2 profile (same as
            -e dbg.profile=profile.rr2)
-w          open file in write mode
-p [prj]    list projects / use project prj
-h          show help message (-hh the verbose one)
```

Example: **r2 -dA /bin/ls**

## Running in different environments: rarusn2

**rarusn2** runs programs with different environments, arguments, permissions, directories and overridden default file-descriptors. Usage:

```
rarusn2 [-t|script-name.rr2] [directives] [--] [prog-name] [args]
rarusn2 -t shows the terminal name, say α, and wait for a connection from another process. For instance, from another terminal, you can execute rarusn2 stduio=α program=/bin/sh (use stduin/stduout to redirect one stream only). Run rarusn2 -h to get a sample .rr2 file.
```

**rarusn2** supports a *lot* of directives, see the man page for details.

## General information

The command **?** prints the help. Command names are hierarchically defined; for instance, all **printing** commands start with **p**. So, to understand what a command does, you can append **?** to a *prefix* of such a command; e.g., to learn what **pdf** does, you can first try **pd?**, then the more general **p?**. You can get recursive help with **?\***; e.g.: **p?\***. Single-line comments can be entered using **#**; e.g. **s # where R we?**. Command **?** can also be used to evaluate an expression and print its result in various format; e.g. **? 5 \* 8+2** (note the space after **?**). Commands **?v/?vi** print result only in hex/decimal. There are also some special **\$**-variables (list them all with: **?\$?**); e.g.:

**\$\$** current virtual seek

**\$b** block size

Where an address *addx* is expected, you can provide any expression that evaluates to an address, e.g. a function name or a register name. In this cheatsheet we sometimes use *fn-name*, instead of *addx*, to emphasize that the argument is supposed to be a function starting address. As default address is (usually?) used the current seek: **\$\$**. All commands that:

- accept an optional size (e.g. **pd**), use the current block size by default (see: **b**)
- accept an optional address (e.g., **pdf**), use the current position by default (see: **s**)

Commands can be chained by using **;;**; e.g. **s fun; pd 2**.

A single command can be applied to each element of a sequence by using **@@**; e.g. **axt @@ str.\***, see **@@?**.

## Internal grep-like filtering

You can filter command output by appending **~[!]*str***, to display only rows [not] containing string *str*; e.g. **pdf~rdx** and **pdf~!rdx**. You can further filter by appending

```
:r          to display row r (0 ≤ r < #rows or, backwards
            with: −#rows ≤ r ≤ −1)
[c1[,c2,...]] to display columns c1,c2,... (0 ≤ ci < #cols)
:r[c1,...,cn] to display columns c1,...,cn of row r
..          to pipe the output into less-like viewer
...         to pipe the output into HUD viewer
```

Examples: **afl~[0]**, **afl~malloc[0]**, **pdf~:2** and **pdf~mov:2**

There is much more (sorting, counting, ...); see: **~?**

## Shell interaction

Command output can be redirected to a file by appending **>filename** or piped to an external command with **|progrname [args]**. Examples: **afl > all\_functions** and **afl | wc -l**.

External commands can be run with **!!progrname [args]**. Note: if a command starts with a single **!**, the rest of the string is passed to currently loaded IO plugin (only if no plugin can handle the command, it is passed to the shell).

Moreover, backticks can be used to send the output of **r2**-commands as arguments; e.g. **!!echo '? 42'**. Vice versa output of external programs can be used as arguments for internal commands; e.g. **pdf 'echo 3' @ 'echo entry0'**.

Some common Unix-like commands are implemented as built-ins; e.g. **ls**, **cd**, **pwd**, **mkdir** and **rm**.

## Radare scripting

**. filename** interpret **r2** script *filename*

**!. command** interpret output of *command* as **r2** commands

## Python scripting (via r2pipe)

You can script Radare2 with Python, by leveraging *r2pipe*, that can be easily installed (inside any Python 2 virtual environment) with:

```
pip install r2pipe.
```

Then, you can spawn a Python interpreter, from inside **r2**, with:

```
#!pipe python [python-file]
```

or simply:

```
#. python-file
```

Once you are in Python-world, you can connect to **r2** by **importing r2pipe** and initializing some variable, say **r2**, with **r2pipe.open("#!pipe")**, or simply **r2pipe.open()**.

Then you can interact with Radare by invoking method **cmd**; e.g. **print(r2.cmd('pdf @ entry0'))**.

You can make most Radare2 commands output in JSON format by appending a **j**; e.g. **pdfj** (instead of **pdf**).

Method **cmdj** can de-serialize JSON output into Python objects; e.g. **f = r2.cmdj('pdfj @ entry0')**  
**print f['name'], f['addr'], f['ops'][0]['opcode']**

## r2pipe: connecting to other r2 instances

You can connect to any web-listening instance of **r2** by passing **r2pipe.open** a string of the form **'http://host:port'**. By using this approach you get your own seek-cursor: your seek commands won't affect others.

To open a background web-service in **r2** use command **=h&**. You may also want to take a look at configuration variable **http.sandbox**.

## Configuration

```
e??          list all variable names and descriptions
e?[?] var-name show description of var-name
e var-name   show the value of var-name
e var-name=?[?] print valid values of var-name [with descript.]
              E.g. e asm.arch=??
e            show the value of all variables
eco theme-name select theme; eg. eco solarized
eco          list available themes
b [size]     display [set] current block size
env [name [=value]] get/set environment variables
```

## Some variables

```
asm.pseudo    enable pseudo-code syntax
asm.bytes     display bytes of each instruction
asm.describe  show opcode description
asm.cmtright  comments at right of disassembly if they fit
asm.emu       run ESIL emulation analysis on disasm
asm.demangle  Show demangled symbols in disasm
bin.demangle  Import demangled symbols from RBin
cmd.bp        command to run when a breakpoint is hit;
              e.g. cmd.bp=!!program
cmd.stack     command to display the stack in visual
              debug mode (Eg: px 32)
dbg.follow.child continue tracing the child process on fork
dbg.slow      show stack and regs in visual mode, in a slow but
              verbose (e.g. telescoping) mode
io.cache      enable cache for IO (=non-persistent write-mode)
scr.utf8      show nice UTF-8 chars instead of ANSI
              (Windows: switch code-page with chcp 65001)
scr.utf8.curvy show curved UTF-8 corners (requires scr.utf8)
scr.nkey      select seek mode (fun, hit, flag); affects commands
              n and N during visual mode
scr.wheel     enables mouse-wheel in visual mode
scr.breaklines break lines in Visual instead of truncating them
```

## Searching: /

```
/ str        search for string str
/x hstr      search for hex-string hstr
/a asm-instr assemble instruction and search for its bytes
/R[/] opcode find ROP gadgets [with r.e.] containing opcode;
              see: http://radare.today/posts/ropnroll/
/A type      find instructions of type type (/A? for the listof types)
Also: e??search for options
```

## Seeking: s

```
s           print current position/address
s addx      seek to addx
s.. hex     changes least-significant part of current address to hex
s+ n and s- n seek n bytes forward/backward
s++ and s-- seek block-size bytes forward/backward
s-          undo seek
s+          redo seek
s=          list seek history
s*          list seek history as r2-commands
```

Writing: w

<b>wa</b> <i>asm-instr</i>	assemble+write opcodes; quote the whole command for more instructions: " <b>wa</b> <i>instr</i> <sub>1</sub> ; <i>instr</i> <sub>2</sub> ; ..."
<b>wao</b> ...	replace current instruction; see <b>wao?</b> for details
<b>w[z]</b> <i>str</i>	write string <i>str</i> [and append byte <code>\x00</code> ]
<b>wx</b> <i>hex-pairs</i>	write hex-pairs
<b>wc</b>	list pending changes (see variable <code>io.cache</code> )
<b>wtf</b> [ <i>file</i> ] [ <i>size</i> ]	write to file
<b>wop0</b> <i>value</i>	find the offset of <i>value</i> inside a De Bruijn pattern; to produce a pattern: <b>ragg2 -r -P size</b>

Analysis (functions and syscalls): a

<b>aaa</b>	analyze ( <b>aa</b> ) and auto-name functions
<b>afl1</b> [ <i>l</i> ]	list functions [with details]
<b>afi</b> <i>fn-name</i>	show verbose info for <i>fn-name</i>
<b>afn</b> <i>new-name addr</i>	(re)name function at address <i>addr</i>
<b>asl</b>	list syscalls
<b>asl</b> <i>name</i>	display syscall-number for <i>name</i>
<b>asl</b> <i>n</i>	display name of syscall number <i>n</i>
<b>afvd</b> <i>var-name</i>	output r2 command for displaying the address and value of arg/local <i>var-name</i>
<b>.afvd</b> <i>var-name</i>	display address and value of <i>var-name</i>
<b>afvn</b> <i>name new-name</i>	rename argument/local variable
<b>afvt</b> <i>name type</i>	change type for given argument/local
<b>afv-</b> <i>name</i>	removes variable <i>name</i>
<b>axt</b> <i>addr</i>	find data/code references to <i>addr</i>
<b>ahi</b> { <i>b d h o r S s</i> } @ <i>addr</i>	define binary/decimal/hex/octal/IP/ syscall/string base for immediate

ESIL: ae

<b>aeim</b>	initialize ESIL VM stack
<b>aeip</b> <i>addr</i>	change ESIL PC to <i>addr</i> ( <b>aeip</b> sets PC to curseek)
<b>aer</b> ...	handle ESIL registers like <b>dr</b> does
<b>aes</b> [ <i>b o</i> ]	perform emulated debugger step [back over]
<b>aesu</b> <i>addr</i>	step until given address

Graphviz/graph code: ag

<b>ag</b> <i>addr</i>	output graphviz code (BB at <i>addr</i> and children) E.g. view the function graph with: <b>ag \$\$   xdot -</b>
<b>agc</b> <i>addr</i>	callgraph of function at <i>addr</i>
<b>agC</b>	full program callgraph

Flags (AKA “bookmarks”): f

<b>fs</b> [ <i>name</i> ]	display flagspaces [select/create <i>fs name</i> ]
<b>fs+</b> <i>name</i>	push previous flag space and set <i>name</i>
<b>fs-</b>	pop to the previous flag space
<b>f</b>	list flags
<b>f</b> <i>name</i> @ <i>addr</i>	<i>or</i>
<b>f</b> <i>name</i> = <i>addr</i>	associate name <i>name</i> to address <i>addr</i>
<b>f-</b> @ <i>addr</i>	remove the association at address <i>addr</i>
<b>f-</b> <i>name</i>	remove the association with name <i>name</i>

Comments: C

<b>CCu</b> <i>text</i> [ @ <i>addr</i> ]	set (update?) comment <i>text</i> at <i>addr</i>
<b>CC</b> <i>text</i> [ @ <i>addr</i> ]	append comment <i>text</i> at <i>addr</i>
<b>CC-</b> [ @ <i>addr</i> ]	remove comment at <i>addr</i>
<b>CC.</b> [ @ <i>addr</i> ]	show comment at <i>addr</i>
<b>CC!</b> [ @ <i>addr</i> ]	edit comment using <code>cfg.editor</code> (vim, ...)

Debugging: d

<b>?d</b> <i>opcode</i>	description of <i>opcode</i> (eg. <b>?d jle</b> )
<b>dc</b>	continue (or start) execution
<b>dcu</b> <i>addr</i>	continue until <i>addr</i> is reached
<b>dcs</b> [ <i>name</i> ]	continue until the next syscall [ <i>name</i> ]
<b>dcr</b>	continue until ret (uses step over)
<b>dr=</b>	show general-purpose regs and their values
<b>dro</b>	show previous (old) values of registers
<b>drr</b>	show register references (telescoping)
<b>dr</b> <i>reg-name</i> = <i>value</i>	set register value
<b>drt</b>	list register types
<b>drt</b> <i>type</i>	list registers of type <i>type</i> and their values
<b>db</b>	list breakpoints
<b>db[-]</b> <i>addr</i>	add [remove] breakpoint
<b>do</b> <i>args</i>	(re)start debugging
<b>ood</b>	synonym for <b>do</b>
<b>ds[o]</b>	step into [over]
<b>dbt</b>	display backtrace (check <code>dbg.btdepth/btalgo</code> )
<b>drx</b>	hardware breakpoints
<b>dm</b>	list memory maps; the asterisk shows where the current offset is
<b>dmm</b>	list modules (libraries, loaded binaries)
<b>dmi</b> [ <i>addr lib</i> ] [ <i>sym</i> ]	list symbols of target lib
<b>dmp</b>	change page permissions (see: <b>dmp?</b> )

Types: t

<b>"td</b> <i>C-type-def</i> "	define a new type
<b>t</b> <i>t-name</i>	show type <i>t-name</i> in <b>pf</b> syntax
<b>.t</b> <i>t-name</i> @ <i>addr</i>	display the value (of type <i>t-name</i> ) at <i>addr</i>
<b>t</b>	list (base?) types
<b>te / ts / tu</b>	list enums/structs/unions
<b>to</b> <i>file</i>	parse type information from C header file
<b>t1</b> <i>t-name</i>	link <i>t-name</i> to current address
<b>t1</b> <i>t-name</i> = <i>addr</i>	link <i>t-name</i> to address <i>addr</i>
<b>t1</b>	list all links in readable format
<b>tp</b> <i>t-name</i> = <i>addr</i>	cast data at <i>addr</i> to type <i>t-name</i> , and prints it

Printing: p

<b>ps</b> [ @ <i>addr</i> ]	print C-string at <i>addr</i> (or current position)
<b>pxr</b> [ <i>n</i> ] [ @ <i>addr</i> ]	print with references to flags/code (telescoping)
<b>px</b> [ <i>n</i> ] [ @ <i>addr</i> ]	hexdump — note: <b>x</b> is an alias for <b>px</b>
<b>px{h w q}</b> ...	hexdump in 16/32/64 bit words
<b>px{H W Q}</b> ...	as the previous one, but one per line
<b>pxl</b> [ <i>n</i> ] [ @ <i>addr</i> ]	display <i>n</i> rows of hexdump
<b>px/fmt</b> [ @ <i>addr</i> ]	gdb-style printing <i>fmt</i> (in gdb see: <b>help x</b> from r2: <b>!!gdb -q -ex 'help x' -ex quit</b> )
<b>pd</b> [ <i>n</i> ] [ @ <i>addr</i> ]	disassemble <i>n</i> instructions
<b>p8</b> [ <i>n</i> ] [ @ <i>addr</i> ]	print bytes
<b>pD</b> [ <i>n</i> ] [ @ <i>addr</i> ]	disassemble <i>n</i> bytes
<b>pd -n</b> [ @ <i>addr</i> ]	disassemble <i>n</i> instructions backwards
<b>pdf</b> [ @ <i>fn-name</i> ]	disassemble function <i>fn-name</i>
<b>pc[p]</b> [ <i>n</i> ] [ @ <i>addr</i> ]	dumps in C [Python] format
<b>*</b> <i>addr</i> [= <i>value</i> ]	shortcut for reading/writing at <i>addr</i>
<b>pf</b> <i>fmt</i> <i>a1</i> [, <i>a2</i> , ...]	formatted print, see <b>pf??</b> and <b>pf???</b>

Information: i (and S)

<b>i</b>	show info of current file
<b>iz[z]</b>	strings in data sections [whole binary]
<b>i{e i l S}</b>	entrypoint/imports/libraries/sections
<b>S</b>	list segments (confusingly called sections!?)

Visual mode: V (q exits)

Command <b>V</b> enters <i>visual mode</i> .	
<b>q</b>	exit visual-mode
<b>c</b>	cursor-mode, <i>tab</i> switches among panels +/- increment/decrement current byte
:	execute a normal-mode command; e.g. <b>:dm</b>
<b>p</b> and <b>P</b>	rotate forward/backward print modes
<b>/str</b>	highlight occurrences of string <i>str</i>
<b>\$</b>	toggle pseudo-syntax
<b>O</b>	toggle ESIL-asm
<b>;</b>	add/remove comments (to current offset)
<b>x</b>	browse xrefs-to current offset
<b>X</b>	browse xrefs-from current function
<b>-</b>	browse flags
<b>d</b>	define function, end-function, rename, ...
<b>di{b o d h s}</b>	define immediate bin/oct/dec/hex or str
<b>V</b>	enter block-graph viewer ( <i>space</i> toggles visual/graph)
<b>A</b>	enter visual-assembler (preview must be confirmed)
<b>n / N</b>	seek next/previous function/flag/hit (see <b>scr.nkey</b> )
<b>i</b>	enter insert mode
<b>e</b>	configures internal variables
<b>"</b>	toggle the column mode

Seeking (in Visual Mode)

<b>.</b>	seeks to program counter
<b>Enter</b>	on jump/call instructions, follow target address
<b>u / U</b>	undo / redo
<b>o</b>	go/seek to given offset
<b>O (zero)</b>	seek to beginning of current function
<b>d</b> (a non-zero digit)	jump to the target marked [ <i>d</i> ]
<b>ml</b> (a letter)	mark the spot with letter <i>l</i>
<b>'l</b>	jump to mark <i>l</i>
<b>n / N</b>	jump to next/previous function

Debugging (in Visual Mode)

<b>b</b> or <b>F2</b>	toggle breakpoint
<b>F4</b>	run to cursor
<b>s</b> or <b>F7</b>	step-into
<b>S</b> or <b>F8</b>	step-over
<b>F9</b>	continue

Projects: P [unstable feature]

<b>P1</b>	list all projects
<b>P{o s d}</b> [ <i>prj-name</i> ]	open/save/delete project <i>prj-name</i>
<b>Pc</b> <i>prj-name</i>	show project script to console
