# Reversing with Radare2

# **Starting Radare**

The basic usage is radare2 executable (on some systems you can use r2 instead of radare2); if you want to run radare2 without opening any file, you can use -- instead of an executable name.

Some command-line options are:

-d file|pid debug executable file or process pid

-A analyze all referenced code (aaa command)

-R profile.rr2 specifies rarun2 profile (same as

-e dbg.profile=profile.rr2)
open file in write mode

-p prj use project prj -p list projects

-h show help message (-hh the verbose one)

Example: r2 -dA /bin/ls

#### General information

The command? prints the help. Command names are hierarchically defined; for instance, all printing commands start with p. So, to understand what a command does, you can append? to a *prefix* of such a command; for instance, to learn what pdf does, you can first try pd?, then the more general p?.

Single-line comments can be entered using #; e.g. s # where R we?.

Command? can also be used to evaluate an expression and print its result in various format; e.g. ? 5 \* 8 + 2 (note the space between? and the expression). There are also some special \$-variables (list all of them with: ?\$?):

\$\$ current virtual seek

\$b block size

Where an address addx is expected, you can provide any expression that evaluates to an address, e.g. a function name or a register name. In this cheatsheet we sometimes use fn-name, instead of addx, to emphasize that the argument is supposed to be a function starting address. As default address is (usually?) used the current seek: \$\$.

All commands that:

- accept an optional size (e.g. pd), use the current block size by default (see: b)
- accept an optional address (e.g., pdf), use the current position by default (see: s)

## Internal grep-like filtering

You can filter command output by appending ~[!]str, to display only rows [not] containing string str; e.g. pdf~rdx and pdf~!rdx. You can further filter by appending

 $\begin{array}{ll} :r & \text{to display row } r \; (0 \leq r < \#rows \; \text{or, backwards} \\ & \text{with: } -\#rows \leq r \leq -1) \\ [c] & \text{to display column } c \; (0 \leq c < \#cols) \\ :r[c] & \text{to display column } c \; \text{of row } r \end{array}$ 

Examples: afl~[0], afl~malloc[0], pdf~:2 and pdf~mov:2

#### Shell interaction

Command output can be redirected to a file by appending >filename or piped to an external command with | progname [args]. Examples: afl > all\_functions and afl | wc -1.

External commands can be run with !!progname [args]. Note: if a command starts with a single !, the rest of the string is passed to currently loaded IO plugin (only if no plugin can handle the command, it is passed to the shell).

The output of external programs can be used as arguments for internal commands by using back-ticks to enclose the invocation of external commands; e.g. pdf 'echo 3' @ 'echo entry0'.

#### Python scripting

Assuming that Python extension has been installed (#! lists installed extensions) an, interactive Python interpreter can be spawned with #!python and a script can be run with #!python script-filename.

Inside the spawned interpreter r2 is an r2pipe object that can be used to interact with the same instance of Radare, by invoking method cmd; e.g. print(r2.cmd('pdf @ entry0')).

In a script the same behaviour can be obtained by importing r2pipe and inizializing r2 with r2pipe.open("#!pipe").

You can make most Radare2 commands output in JSON format by appending a j; e.g. pdfj (instead of pdf).

Method cmdj can de-serialize JSON output into Python objects; e.g. f = r2.cmdj('pdfj @ entry0')

print f['name'], f['addr'], f['ops'][0]['opcode']

# Configuration

e??	list all variable names and descriptions
e?[?] var-name	show description of var-name
e var-name	show the value of var-name
е	show the value of all variables
${\tt eco}\ theme{-}name$	select theme; eg. eco solarized
eco	list available themes
b	display current block size
b $size$	set block size
env [name [=value]]	get/set environment variables

#### Some variables

asm.pseudo	enable pseudo-code syntax (in visual mode, toggle with: \$)
asm.bytes	display bytes of each instruction
asm.cmtright	comments at right of disassembly if they fit
asm.emu asm.demangle	run ESIL emulation analysis on disasm Show demangled symbols in disasm
asm.demangre	Show demangred symbols in disasin
bin.demangle	Import demangled symbols from RBin
cmd.stack	command to display the stack in visual
	debug mode (Eg: px 32)
dbg.follow.child	continue tracing the child process on fork
io.cache	anable anabe for IO abangos
10.cacne	enable cache for IO changes (AKA non-persistent write-mode)
	(TITTI non persistent write mede)
scr.utf8	show nice UTF-8 chars instead of ANSI
	(Windows: switch code-page with chcp 65001)
scr.nkey	select seek mode (fun, hit, flag); affects commands n and N during visual mode

enables mouse-wheel in visual mode

#### Example: my ~/.radare2rc

```
e asm.bytes=0
e scr.utf8=true
e asm.cmtright=true
e cmd.stack=px 32
e scr.wheel=false
eco solarized
```

scr.wheel

# Searching: /

/ str search for string str
/x hstr search for hex-string hstr
/a asm-instr assemble instruction and search for its bytes
find ROP gadgets containing opcode;
see: http://radare.today/posts/ropnroll/

Also: e??search for options

## Seeking: s

S	print current position/address
$\mathbf{s}$ $addx$	seek to addx
s+ $n$	seek $n$ bytes forward
s++	seek block-size bytes forward
s-n	seek n bytes backward
s	seek block-size bytes backward
s-	undo seek
s+	redo seek
s=	list seek history
s*	list seek history as r2-commands

## Writing: w

wa asm-instr assemble and write opcodes; for more instructions the whole command must be quoted:

"wa  $asm-instr_1$ ;  $asm-instr_2$ ; ..."

w strwrite string str

write string str and append byte  $\x00$ wz str

wx hex-pairs write hex-pairs

# Analysis (functions and syscalls): a

aaa	analyze (aa) and auto-name all functions
afl	list functions
afll	list functions with details
afi $fn$ - $name$	show verbose info for fn-name
${\tt afn}\ new{-}name\ addx$	name function at address $addx$
$\verb"afn" new-name" old-name"$	rename function
asl	list syscalls
asl $name$	display syscall-number for name
$\verb"asl" n$	display name of syscall number $n$
afvd $var$ - $name$	output r2 command for displaying the
	address and value of arg/local var-name
.afvd $var ext{-}name$	display address and value of var-name
afvn name new-name	rename argument/local variable
afvt name type	change type for given argument/local
$\mathtt{axt}\ addx$	find data/code references to $addx$

## Graphviz/graph code: ag

output graphviz code (BB at addr and children)  $ag \ addr$ E.g. view the function graph with: ag \$\$ | xdot callgraph of function at addx $agc \ addr$ 

full program callgraph agC

#### Information: i

show info of current file ie entrypoint iz strings in data sections strings in the whole binary izz il libraries

ii imports sections

# Printing: p

print C-string at $addx$ (or current position) print $n$ bytes (or block-size), as words, with references to flags and code (telescoping) at
addx (or current position)
hexdump
hexdump half-words (16 bits)
hexdump words (32 bits)
hexdump quad-words (64 bits)
display $n$ rows of hexdump
gdb-style printing $fmt$ (in gdb see: help x
from r2: !!gdb -q -ex 'help x' -ex quit)
disassemble $n$ instructions
disassemble $n$ bytes
disassemble $n$ instructions backwards
disassemble function $fn$ -name
pseudo-disassemble in C-like syntax

## Debugging: d

?d opcode description of opcode (eg. ?d jle) dc continue (or start) execution dcu addxcontinue until addx is reached dcs [name] continue until the next syscall (named name. if specified) dcr continue until ret (uses step over) show general-purpose regs and their values dr= show previous (old) values of registers dro show register references (telescoping) drr set register value dr rea-name = valuelist register types drt list registers of type type and their values drt type db list breakpoints add breakpoint  $db \ addx$ db - addxremove breakpoint (re)start debugging doo args ood synonym for doo step into ds dso step over dbt display backtrace drx hardware breakpoints list memory maps; the asterisk shows where dm

the current offset is

change page permissions (see: dmp?)

## Types: t "td C-tupe-def"

dmp

show type t-name in pf syntax t t-name display the value (of type t-name) at addx.t t-name @ addx list (base?) types te list enums ts list structs list unions tu to file parse type information from C header file link t-name to current address tl t-name t1 t-name = addxlink t-name to address addx list all links in readable format

define a new type

## Visual mode: V

Command V enters visual mode. exit visual-mode cursor-mode, tab switches among stack/regs/disassembly С execute a normal-mode command; e.g. :dm p and P rotate forward/backward print modes /str highlight occurences of string str \$ toggle pseudo-syntax toggle ESIL-asm 0 add/remove comments (to current offset) browse xrefs-to current offset х Х browse xrefs-from current function browse flags d define function, end-function, rename, ... V enter block-graph viewer enter visual-assembler seek next/previous function/flag/hit (see scr.nkey)

### Seeking (in Visual Mode)

seeks to program counter Enteron jump/call instructions, follow target address undo u redo go/seek to given offset d (a digit) jump to the target marked [d] ml (a letter) mark the spot with letter l, 1 jump to mark liump to next function n jump to previous function

#### Debugging (in Visual Mode)

b or F2 toggle breakpoint F4 run to cursor s or F7 step-into S or F8 step-over F9 continue

# Flags (AKA "bookmarks"): f

Note: in order to get your defined names appear in disassembly, you must include a prefix (fun, sub, obj, ...); e.g. f obj.foo @ 0x1234

f name @ addx

f name = addxassociate name name to address addxf- @ addxremove the association at address addx f- name remove the association with name name

#### Comments: C

list all comments in human friendly form CCu text [@ addx] set (update?) comment text at addx CC text [@ addx] append comment text at addx CC-[@addx]remove comment at addx CC. [@ addx]show comment at addxCC! [@ addx]edit comment using cfg.editor (vim, ...)

## Projects: P

list all projects Ps [prj-name] save project prj-name Po prj-name open project prj-name Pd prj-name delete project prj-name

## Running in different environments: rarun2

rarun2 is used as a launcher for running programs with different environment, arguments, permissions, directories and overridden default file-descriptors. Usage:

rarun2 [-t|script-name.rr2] [directives] [--] [prog-name] [args]

rarun2 -t shows the terminal name, say  $\alpha$ , and wait for a connection from another process. For instance, from another terminal, you can execute rarun2 stdio= $\alpha$  program=/bin/sh (use stdin/stdout to redirect one stream only).

rarun2 supports a lot of directives, see the man page.
